

# AI Prompt Pack - Pricing Edition

5 field-tested prompts. Structure: Role, Context, Task, Output - plus the failure mode of each.

---

## The rule that makes all five work

AI drafts, you decide. Every output gets checked against your real data before it touches a price - AI will state an invented number with total confidence (ours once invented a pack size that doesn't exist). A prompt without YOUR context in the [brackets] produces generic garbage. Fill them.

### 1. Competitor price scan

*Replaces: the 6-hour quarterly spreadsheet exercise.*

Act as a B2B pricing analyst. Context: here is our price list and competitor prices from distributor feedback, tenders and market reports, with dates: [PASTE DATA]. Task: identify (a) where competitors moved vs last quarter, (b) where our price gaps changed more than 3%, (c) which changes look tactical (promotions) vs structural (repositioning), (d) movements that repeat across markets with a time lag. Output: a table by product with flagged movements, and the 3 gaps that need a management decision.

Failure mode: treats old data as current. Date-stamp every input and say "ignore data older than X".

### 2. Discount break-even check

*Replaces: approving deals on gut feel at 6pm.*

Act as a commercial finance partner. Context: product margin is [X]%, sales requests a [Y]% discount on [VOLUME] with expected market growth of [Z]%. Task: calculate the additional volume needed to keep absolute margin flat, and state whether that growth is realistic in this market. Output: break-even volume %, and a one-paragraph recommendation a sales director will actually read.

Failure mode: mixes margin definitions. Specify gross vs contribution margin explicitly.

### 3. Price increase objection prep

*Replaces: improvising answers in the car before the meeting.*

Act as the procurement manager of [CUSTOMER TYPE]. Context: you just received our +[X]% increase letter: [PASTE LETTER]. Task: raise your 5 toughest objections, ranked by how much they hurt. Then switch roles: as my negotiation coach, help me answer each one with value arguments, not apologies. Output: objection-response pairs, each response under 60 words.

Failure mode: generic objections. Feed it the real letter and the customer's industry, or it rehearses the wrong meeting.

### 4. Win/loss pattern analysis

*Replaces: assuming you know why you lose.*

Act as a revenue analyst. Context: here are [N] anonymized win/loss records with deal size, segment, competitor, stated loss reason: [PASTE]. Task: find where we actually lose on price vs where the loss reason says "price" but the pattern says otherwise (speed, risk, relationship). Output: top 3 patterns with supporting counts, and one action per pattern.

Failure mode: invents patterns in small samples. Below ~30 records, ask it to state confidence per pattern.

## 5. Scenario model sketch

*Replaces: the 11pm algebra session.*

Act as a pricing analyst. Context: current price [P], volume [V], margin [M]%, estimated elasticity or historical reaction: [DATA]. Task: model scenarios of price moves of -3%, 0%, +3%, +5% with volume risk ranges, showing revenue and absolute margin impact per scenario. Output: one table, one recommendation, all assumptions listed at the bottom.

Failure mode: fabricates elasticity if you give none. Force it: "if elasticity data is missing, say so and use my three assumptions instead".

*Works with Claude, ChatGPT or any capable model. The verification step is not optional - use it, verify it, own the output.*
